## Common turning inserts

Introduction of chipbreaker	A13-A14
Processing application note	A15-A22
Common turning inserts	A24-A62
Common turning inserts naming rules	A24-A25
Cemented carbide inserts	A26-A62
List of negative inserts	A26-A46
List of positive inserts	A47-A62

### Negative inserts with holes

Introduction of chipbreaker

Use	Chipbreaker	Tolerance	Accuracy Recommended	Feature/Shape
Roughing	GR Double-side	M	ap=3~12(mm) fn=0.3~0.8(mm/r)	For P & K type light load roughing M class double chip breaker, metal removal rate and edge economy can have it all. 
	GR One-side	M	ap=3~15(mm) fn=0.3~0.8 (mm/r)	For P type roughing M class single chip breaker, high safety, edge in high cutting depth, high cutting feed can obtain high metal removal rate and low cutting force. 
	BR	M	ap=2.5~8(mm) fn=0.2~0.6(mm/r)	For M type roughing M class double chip breaker, strong impact resistance, groove type design made the best balance between safety and sharp edge, solved the big cutting-heat, stick knives and other difficulties in the process of roughing of stainless steel, obtained the high efficiency. 
	KR	M	ap=5~15(mm) fn= 0.3~1.0(mm/r)	For K type heavy load machining M class double chip breaker, tough edge, with a high security, strong ability to resist plastic deformation at high removal rate. 
	Semi-finishing	GS	M	ap=1.5~5(mm) fn=0.15~0.5(mm/r)
GM		M	ap=1.5~5(mm) fn=0.15~0.5(mm/r)	For P type Semi-finishing M class double chip breaker, edge is stronger than GS, suitable for Semi-finishing at unstable condition, cast iron processing, lower cutting force. 
BM		M	ap=0.5~1.5(mm) fn=0.1~0.3(mm/r)	For M type Semi-finishing M class double chip breaker, effectively solve the processing difficulty, such as stainless steel breaking chip, stick knife, obtain higher processing efficiency than BF. 
Straight slot		M	ap=1.5~5(mm) fn=0.2~0.5(mm/r)	For P,M&K type Semi-finishing to roughing M class double chip breaker, edge tough, good versatility. 
Finishing		GF	M	ap=0.3~2(mm) fn=0.05~0.35(mm/r)
	BF	M	ap=0.05~1(mm) fn=0.05~0.3 (mm/r)	For M type Finishing M class double chipbreaker, a sharp edge, effectively solve the processing difficulty, such as stainless steel breaking chip, stick knife, surface hardening, get high quality.

# Turning

## Common turning Introduction of grooving inserts

### Negative insert with hole

Use	Chipbreaker	Tolerance	Accuracy Recommended	Feature/Shape
Roughing	HR	M	ap=3~7(mm) fn=0.3~0.7(mm/r)	For roughing M class tolerance, suitable for internal and external roughing of steel, stainless steel and cast iron materials. 
Semi-Finishing	HM	M	ap=1~4(mm) fn=0.2~0.5(mm/r)	For semi-finishing M class tolerance, suitable for internal and external semi-finishing of steel and cast iron materials. 
Finishing	HF	G	ap=0.1~2(mm) fn=0.05~0.3 (mm/r)	For finishing M class tolerance, suitable for internal and external semi-finishing of steel and cast iron materials. 
Aluminium alloy machining	AC	G	ap=0.02~4.8(mm) fn=0.05~0.5(mm/r)	For Aluminum machining G class tolerance, big rake angle and clearance angle make more sharp edge, cutting lighter under the condition of ensure effective chip breaker. 

Introduction of grooving

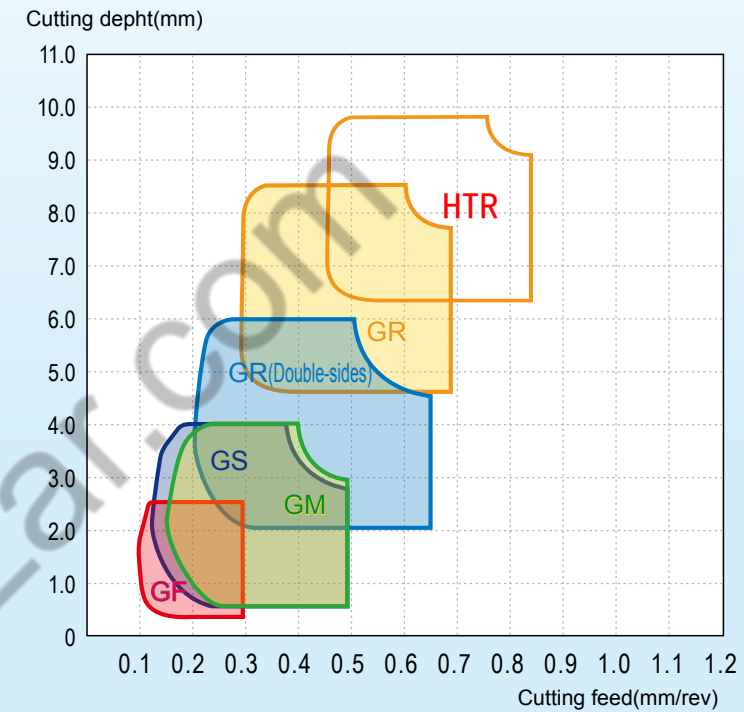

## Common turning processing Processing application note

# Turning

### Main scope of prove type of chipbreaker

#### Negative inserts

Processing application note

◆ Material:45#steel

◆ Material:stainless steel(1Cr18Ni9Ti)

#### Positive inserts

◆ Material:45#steel

◆ Material:stainless steel(1Cr18Ni9Ti)

◆ Material: aluminum alloy

- Surface gold TiN has the excellency of reducing the friction and wear recognition effect.
- Special structure of Al<sub>2</sub>O<sub>3</sub> settled layer has the best thermal barrier performance, high speed dry cutting, ensure resistance to plastic deformation of blade matrix at high speed dry cutting.
- TiCN layer with anti-wear material abrasion performance lead to the best wear resistant of the face of clearance angle.
- Using gradient sintering technology, and increase the impact resistance and wear resistance of insert, so as to improve the ability to resist damage of the insert.
- Carbide with special crystal structure improves the red hardness of the blade matrix, and strengthened the high temperature resistant performance of insert.

### JT4015

High wear-resistant substrates combine with MT-TiCN,thick Al<sub>2</sub>O<sub>3</sub>,TiN coatings,excellent grades of steel,cast steel & stainless steel materials' finish processing at high speed cutting conditions.

### JT4025

Special strength & toughness of the blade's substrates,perfect combinations with MT-TiCN,thick Al<sub>2</sub>O<sub>3</sub>, TiN coating,common grades for steel,suitable for steel,cast steel & stainless steel in semi-finishing,finishing.

### JT4035

High-strength resistance & antiplastic deformation substrates,combining with MT-TiCN,thick Al<sub>2</sub>O<sub>3</sub>, TiN coating,good toughness & anti-plastic deformation,suitable for steel,cast steel & stainless steel in light-roughing & roughing.

### JT4330

High hardness substrates,medium and high speed, suitable for light & heavy milling of low alloy steel & unalloyed steel,also suitable for milling at low condition.

### JT4340

Wear-resistant & good toughness substrates, common coating cemented carbide grades, used for medium and low speed milling of steel, cast iron, hardened steel.

### JT4350

Good toughness & wear-resistant substrates, perfect combinations with MT-TiCN, superfine Al<sub>2</sub>O<sub>3</sub>, common coating cemented carbide grades, used for medium and low speed milling of steel, cast iron, hardened steel.

### JT3105

Coatings & tough substrates combination,supporting high-temperature & unplastic-deformation,suitable for ductile cast iron,forged cast-iron with high strength,ferrosteel in finishing & semi-finishing.

### JT3115

High wear-resistant substrates,perfect combinations with MTTi(CN),thick Al<sub>2</sub>O<sub>3</sub> coating,initial grades for ductile cast iron,forged cast iron,highly cutting speed allowance.

### JT3125

Wear-resistant & good toughness substrates,perfect combinations with MT-Ti(CN), thick Al<sub>2</sub>O<sub>3</sub> coating,initial grades for ductile cast iron & forged cast iron in roughing & highly-metal.

### JT4115

High wear resistant substrates combine with MT-TiCN, thick Al<sub>2</sub>O<sub>3</sub> coatings,excellent grades of steel,cast steel & stainless steel materials' finish processing at high-speed cutting conditions.

### JT4125

Special strength & toughness of the insert substrates,perfect combinations with MT-TiCN, ultra fine Al<sub>2</sub>O<sub>3</sub> coatings,common grades for steel,suitable for steel,cast steel & stainless steel in semi-finishing,finishing.

### JT4135

High-strength resistance & antiplastic deformation substrates,combining with MT-TiCN, ultra fine Al<sub>2</sub>O<sub>3</sub>, coatings,good toughness & anti-plastic deformation,suitable for steel,cast steel & stainless steel in light-roughing & roughing.

## Higher cutting speed and longer life of insert Black general insert

*The second generation of steel processing*

Before the surface treatment

After the surface treatment

The inserts with special surface technology, greatly improved the surface roughness, effectively reduce the cutting force, reduce the adhesive between the cutter surface and the processed material, greatly improve the stability of inserts to use.

Fibrous TiCN and the perfect combination of fine grain Al<sub>2</sub>O<sub>3</sub> coating significantly improved the wear resistance and resistance to collapse of insert.

### Contrast effect of insert abrasion test

Workpiece(42CrMo Type:CNMG120408-GS Cutting parameter:Vc=390m/min ap=1.5mm fn=0.2mm/r

## Black general insert

First choice for high-speed and efficient processing of cast iron

● Thick  $Al_2O_3$  coating combined with strong impact resistance matrix, the insert has the stable high temperature red hardness and good impact resistance, improves the wear resistance of the insert under the requirement of high speed, high feed machining cast iron.

● All black product color shows more high-end

### Remarkable result

- Improve the production efficiency, coating and substrate are all adapted to cast iron of high speed and high feed cutting. **Cutting speed can be increased by 30% - 40%.**
- Reduce the cost, **improve the tool life of nearly 40% to 50%.**
- High stability of processing

### JT3205

Coatings & tough substrates combination, supporting high temperature & unelastic deformation, suitable for ductile cast iron, forged cast iron with high strength, ferosteel in finishing & semi-finishing.

### JT3215

High wear-resistant substrates, perfect combinations with MT-Ti(CN), ultra  $Al_2O_3$ , TiN coatings, initial grades for ductile cast iron, forged cast iron, highly cutting speed allowance

### JT3225

Wear-resistant & good toughness substrates, perfect combinations with MT-Ti(CN), ultra  $Al_2O_3$ , TiN coatings, initial grades for ductile cast iron & forged cast iron in roughing & highly-metal.

Density fine grain layer of surface

CVD Coated cemented carbide

## JT4215

High wear-resistant substrates, combinations with MT-TiCN, superfine Al<sub>2</sub>O<sub>3</sub>, TiN coating; excellent grades of steel, cast steel & stainless steel materials' finish processing at high-speed cutting conditions.

## JT4225

Special strength & toughness of the insert substrates, perfect combinations with MT-TiCN, superfine Al<sub>2</sub>O<sub>3</sub>, TiN coating; common grades for steel, suitable for steel, cast steel & stainless steel in semi-finishing, finishing, etc.

## JT4235

High-strength resistance & antiplastic deformation substrates, combining with MT-TiCN, superfine Al<sub>2</sub>O<sub>3</sub>, TiN coatings, good toughness & anti-plastic deformation, suitable for steel, cast steel & stainless steel in light-roughing & roughing.

## JT4240

Wear-resistant & good toughness substrates, common coating cemented carbide grades, used for medium and low speed milling of steel, cast iron, hardened steel.

## JT4250

Excellent toughness substrates, Suitable for medium and heavy milling of steel & cast stainless steel.

## JT3205

Coatings & tough substrates combination, supporting high-temperature & unplastic-deformation, suitable for ductile cast iron, forged cast-iron with high strength, ferrosteel in finishing & semi-finishing.

## JT3215

High wear-resistant substrates, perfect combinations with MT-TiCN, superfine Al<sub>2</sub>O<sub>3</sub>, TiN coating; initial grades for ductile cast iron, forged cast iron, highly cutting speed allowance.

## JT3225

Wear-resistant & good toughness substrates, perfect combinations with MT-Ti(CN), superfine Al<sub>2</sub>O<sub>3</sub>, TiN coating; initial grades for ductile cast iron & forged cast iron in roughing & highly-metal.

## JT3220

Wear-resistant & good toughness substrates, perfect combinations with Thin MT-Ti(CN), superfine Al<sub>2</sub>O<sub>3</sub>, TiN coating; initial grades for ductile cast iron & forged cast iron in roughing & highly-metal.

## JT3240

Wear-resistant & good toughness substrates, common coating cemented carbide grades, used for medium and low speed milling of steel, cast iron, hardened steel.

## JT4015

High wear-resistant substrates, combinations with MT-TiCN, thick Al<sub>2</sub>O<sub>3</sub>, TiN coating; excellent grades of steel, cast steel & stainless steel materials' finish processing at high-speed cutting conditions.

## JT4025

Special strength & toughness of the insert substrates, perfect combinations with MT-TiCN, thick Al<sub>2</sub>O<sub>3</sub>, TiN coating; common grades for steel, suitable for steel, cast steel & stainless steel in semi-finishing, finishing.

## JT4035

High-strength resistance & antiplastic deformation substrates, combining with MT-TiCN, thick Al<sub>2</sub>O<sub>3</sub>, TiN coatings, good toughness & anti-plastic deformation, suitable for steel, cast steel & stainless steel in light-roughing & roughing.

## JT3005

Coating & tough substrates combination, supporting high temperature & unplastic deformation. Suitable for ductile cast iron, forged cast iron with high strength, ferrosteel in finishing & semi-finishing.

## JT3015

High wear-resistant substrates, combinations with MT-TiCN, thick Al<sub>2</sub>O<sub>3</sub>, TiN coating; initial grades for ductile cast iron, forged cast iron, highly cutting speed allowance.

## JT3025

Wear-resistant & good toughness substrates, perfect combinations with MT-Ti(CN), thick Al<sub>2</sub>O<sub>3</sub>, TiN coating; initial grades for ductile cast iron & forged cast iron in roughing & highly-metal.

## JT4030

High hardness substrates, medium and high speed; suitable for light & heavy milling of low alloy steel & unalloyed steel, also suitable for milling at low condition.

## JT4040

Wear-resistant & good toughness substrates, common coating cemented carbide grades, used for medium and low speed milling of steel, cast iron, hardened steel.

## JT4050

Excellent toughness substrates, suitable for medium and heavy milling of steel & cast stainless steel.

CVD Coated cemented carbide

CVD Coated cemented carbide

# PVD coated cemented carbide

Let the difficult machining materials gets easy

## New grade of nano coated

- Special coating process lead to smooth surface, low cutting resistance force and easy chip-flow.
- Unique nano structure coating, closer integration with the substrate, towards higher toughness and hardness.
- Good thermal stability and chemical stability of cutting edges provide more effective protection.

High performance TiAlN coated of nano structure ensures that the insert has a very high toughness and hardness. Unique coating technology makes the insert with smooth surface and high wear resistance, excellent thermal stability and chemical stability provide effective protection of cutting edge

nc-TiAlN Coating(JT1025)

The coating surface of JT1025

### JT1015

2-4 $\mu$ m TiAlN PVD coated, combining with fine particles' substrates with high-toughness, suitable for all materials, high-temperature alloy & Ti alloy in finishing, semi-finishing.

### JT1025

2-4 $\mu$ m TiAlN PVD coated, combining with ultra fine particles' substrates with high-toughness, suitable for all materials, stainless steel & high-temperature alloy in finishing, semi-finishing.

### JT1035

PVD coated, combining with high-resistant substrates, suitable for all materials in roughing, semi-finishing.

### JT1215

3-5 $\mu$ m TiAlN+TiAlSiN PVD Coated, high wear resistance, high oxidation resistance, combined with fine particle's substrates with excellent performance, suitable for light, medium load milling.

### JT1225

2-4 $\mu$ m AlCrN+AlCrSiN PVD coated, combining with ultra fine particles' substrates with high-toughness, suitable for all materials in light & medium load milling, stainless steel & high-temperature high hardness alloy in finishing, semi-finishing.

### JT1235

3-5 $\mu$ m TiAlN+TiAlSiN PVD Coated, high wear resistance, high oxidation resistance, combined with hard alloy with excellent toughness cemented carbide substrates, suitable for all kinds of processed materials with high hardness and medium load milling and drilling, stainless steel and high temperature alloy in semi-finishing, rough turning, cutting and grooving, achieving the combination of the perfect safety and wear resistance.

## JPP302

Excellent toughness substrates and ALTiN PVD coated, Suitable for medium and heavy milling of steel & cast stainless steel.

## JPP402

Excellent toughness substrates and ALTiN PVD coated, Suitable for strong cutting steel, cast steel, should be used in low-speed and high feed processing under harsh conditions.

BavandAbzar.com

PVD Coated cemented carbide

# Grades of cemented carbide

Uncoated carbide grades are widely used in non-ferrous metal, high temperature alloys and other materials processing, manifests the versatility and efficiency in application.

JT002 substrate - The combination of fine grain WC hard phase and binder phase Co.

JK202 substrate, the combination of medium grain WC hard phase and binder phase Co.

## JP302

Suitable for finishing and semi-finishing steel, cast steel, appropriate uses high cutting speed and medium, small feed, and suitable for profile turning.

## JP402

For strong cutting steel, cast steel, should be used in low-speed and high feed processing under harsh conditions.

## JK002

Suitable for finishing and semi-finishing steel, cast steel, appropriate uses high cutting speed and medium, small feed.

## JK202

Used for semi-finishing of cast iron, heat resistant alloy, also used in plastic, rubber, wood and other non-metallic materials processing. Especially suitable for the aviation industry which has a sharp edge requirements. Appropriate use medium cutting speed and higher feed. Has good abrasion resistance and toughness.

## JK001

Suitable for finishing, semi-finishing cast iron, nonferrous metals, especially aluminum, and processing manganese steel, hardened steel and other hard materials.

### Recommended cutting condition

Workpiece		Machine range	Grade	Recommended cutting speed (m/min)
P Steel		Semi-finishing	JP302	120-300
		Roughing	JP402	90-280
K Cast iron		Finishing	JK002	110-160
		Semi-finishing to Roughing	JK202	70-120
N Nonferrous metal		Finishing to Semi-finishing	JK001	120-1800

### Common problems and solution

Problems	Reason	solution	Material		Cutting condition			Shape					Machine clamping						
			Material with higher hardness	Material with better toughness	Cutting speed	Feed rate	Cutting depth	Cutting liquid	Change insert groove	Rake angle	Nose radius	Approach angle	Strength of cutting edge	Improve insert accuracy	Improve the rigidity of toolholder	Improve the rigidity of workpiece	Clamping system of workpiece	Overhang of tool	Power gap
Sawee abrasion of tool nose	Bad precision in machining	Flank surface of blade insert wear increased	✓																
		Cutting condition is not appropriate			↓	↑													
Surface accuracy deterioration	Poor surface quality	Tool wear increase and cutting edge not sharp enough	✓		↓			✓		↑	↑	↓	✓						
		Fracture of cutting edge		✓		↓	↓		✓		↑	↑			✓	✓	✓		
		Unsuitable geometrical shape of cutting edge							✓		↑	↓	✓						
		Cutting condition is not appropriate			↑	↓	↓	✓											
		Vibration, tremble		✓		↓	↓	✓	✓	↑	↓	↑	↓		✓	✓	✓	✓	
	Built-up edge			↑	↑		✓	✓	↑		↓	✓							
Thermal	The influence of cutting heat	Cutting condition is not appropriate			↓	↓	↓												
		Unsuitable geometrical shape of cutting edge	✓						✓	↑		↓							
Poor dimension accuracy	Unstable size	Insert tolerance											✓						
		Offset of workpiece or tools							✓	↑	↓	↑		✓	✓	✓	✓		
Fracture of cutting edge	Flank surface	Abrasion on clearance angle	✓		↓				✓	↑	↑	↓							
		Abrasion on rake angle	✓		↓	↓	↓		✓	↑		↓							
	Edge chipping		✓		↓	↓		✓			↓	↑		✓	✓	✓	✓		
	Built-up edge	The hardness of workpiece and cutting condition does not adapt			↑	↑		✓	✓	↑		↓	✓						
Heat crack	The hardness of workpiece and cutting tool materials and cutting condition does not adapt				↓	↓	↓	✓	✓	↑		↓							
		Deformation of cutting edge nose	✓		↑	↓	↓	✓	✓	↑	↑	↓	↓						
		Tool life	Material and cutting condition is not appropriate	✓		↓	↓		✓		↑	↓	↑		✓	✓	✓	✓	
Chippings control	Long chip winding	Cutting condition is not appropriate			↓	↑	↑	✓											
		Unsuitable geometrical shape of cutting edge							✓		↓	↑							
Chip is shot lead to solash	Cutting condition is not appropriate				↓	↓		✓											
		Unsuitable geometrical shape of cutting edge							✓		↑	↓							
Burr, side collapse	Steel aluminum produce burr	Cutting condition is not appropriate			↑	↓		✓											
		Tool abrasion and unsuitable geometrical shape	✓						✓	↑	↓	↑	↓						
	Cast iron, the collapse edge	Cutting condition is not appropriate			↓	↑			✓	✓	↓	↓	↓						
		Tool abrasion and unsuitable geometrical shape	✓						✓		↓	↓	↓						
Mild steel, the burrs	Cutting condition is not appropriate				↓	↓													
		Tool abrasion and unsuitable geometrical shape	✓						✓	↑	↑		↑		✓	✓	✓	✓	

### ■ Abrasion of tools and various damages

Tool damage type	Phenomenon	Reason	Solution
flank wear	cutting resistance increase groove wear gradually in flank surface	tool material is too soft cutting speed is too high the clearance angle is too small low feed	<ul style="list-style-type: none"> <li>◆ choose tool materials of high wear resistance</li> <li>◆ lower cutting speed</li> <li>◆ increase clearance angle</li> <li>◆ increase cutting feed</li> </ul>
rake face wear (crater wear)	chipbreaking control is bad surface quality deterioration	tool material is too soft cutting speed is too high high feed	<ul style="list-style-type: none"> <li>◆ choose tool materials of high wear resistance</li> <li>◆ lower cutting speed</li> <li>◆ reduce cutting feed</li> </ul>
cutting edge breakage	sudden collapse edge tool life is unstable	tool material is too tough high feed cutting intensity is not enough tool rod and handle less rigid	<ul style="list-style-type: none"> <li>◆ choose higher material toughness</li> <li>◆ reduce cutting feed</li> <li>◆ increase the edge grinding (if rounding, chamfer instead)</li> <li>◆ increase the toolholder size</li> </ul>
damage	cutting resistance increase deterioration of the surface roughness	tool material is too tough high cutting feed cutting edge strength is not enough tool rod and handle less rigid	<ul style="list-style-type: none"> <li>◆ choose higher material toughness</li> <li>◆ reduce cutting feed</li> <li>◆ increase the edge grinding (if rounding, chamfer instead)</li> <li>◆ increase the toolholder size</li> </ul>
plastic deformation (cutting edge collapse)	workpiece size change nose abrasion	tool material is too soft cutting speed is too high cutting depth and feed are too high cutting depth and feed is too high cutting edge temperature is too high	<ul style="list-style-type: none"> <li>◆ choose tool materials of high wear resistance</li> <li>◆ lower cutting speed</li> <li>◆ reduce cutting depth and feed</li> <li>◆ use high thermal conductivity of tool materials</li> </ul>
built-up edge (bond)	finishing surface deterioration cutting resistance increase	low cutting speed cutting edge is not sharp tool material is not suitable	<ul style="list-style-type: none"> <li>◆ higher cutting speed</li> <li>◆ increase rake angle</li> <li>◆ choose small affinity tool material (coating, cermet, etc.)</li> </ul>
heat crack	collapse loss due to thermal cycling in interrupted cutting	expansion and contraction caused by cutting heat tool material is too tough	<ul style="list-style-type: none"> <li>◆ dry cutting</li> <li>◆ choose higher material toughness</li> </ul>
boundary wear	produce burr cutting resistance increase	high feed, high cutting speed	<ul style="list-style-type: none"> <li>◆ choose tool materials of high wear resistance</li> <li>◆ increase rake angle to improve the edge sharpness</li> <li>◆ lower cutting speed</li> </ul>
peel off	usually occurring in high hardness materials, vibration cutting	cutting edge bonding poor chip removal	<ul style="list-style-type: none"> <li>◆ increase rake angle to improve the edge sharpness</li> <li>◆ increase the chip flute</li> </ul>

## Part off and groove tool center height control

- No matter what tool you choose, only guarantee the blade and the center line of the workpiece installation into 90 degree, to obtain the ideal processing surface, and reduce the vibration phenomenon in processing.
- Blade edge line with the workpiece center height tolerance should maintain  $\pm 0.1$  mm, especially bar cutting and grooving of small diameter workpiece, can increase the tool life, reduce the cutting resistance, decrease the burr.

### Parting off

- When the blade close to the workpiece center, should reduce the feed rate of 30%, to improve tool life and surface quality.
- Under permission, decrease overhanging as far as possible, to ensure good stability.

### External grooving and turning, profiling

- Feeding order: cutting depth  $> 0.5$  mm, the radial feed (maximum cutting depth can be  $0.75 \times \text{edge width } S$ )  $\rightarrow$  radial return around  $0.1$  mm  $\rightarrow$  axial feeding  $\rightarrow$  oblique knife back  $\rightarrow$  axial feeding  $\rightarrow$  radial processing to the required depth.
- Bottom diameter or chamfer (finishing), uses the operating sequence as shown, can reduce the friction of tool and chip and small vibration.

### Face grooving and turning

- Finishing (multiple groove turning)  
From the max diameter cutting inside, return when the edge of the blade slightly inward migration. See (1)
- The groove turning  
The axial cutting depth is less than  $0.75 \times S$  (Width of cutting edge)  
Groove width greater than groove depth, it is recommended to use groove cutting. See (2)  
Groove depth greater than groove width, it is recommended to use multiple groove cutting
- Finishing  
Finishing bottom and outside edge at the first, and then finishing bore to the required size. See (3)

### Internal grooving and turning

- Using the graphic processing order  
Easy to chip outflow, away from the end of the hole direction always start to feed

Golden yellow TiN surface reduces friction and wear recognition effect

The inner nc - TiAlN coatings have excellent wear resistance

## JT1125

Nc - TiAlN coatings combined with ultra fine particles of strong toughness matrix, is suitable for all kinds of processed material of finishing and semi-finishing and high temperature alloy rough turning processing.

Nc - TiAlN coatings combined with ultra fine particles of strong toughness matrix, is suitable for all kinds of processed material of finishing and semi-finishing and high temperature alloy rough turning processing.

## JT1025

TiN and PVD coating alloy, with good toughness and wear resistance, it is a special grade for machining of carbon steel, stainless steel and cast iron, etc.

# Turning

## Thread toolholder naming rules

**S W R 20 20 K 16**

### Nose height(mm)

Note: Round holder is represented by 00.  
Marked only integer, for example: h=8mm, labeled 08.

### Width of tool(mm)

Note: Round holder is represented by diameter.  
for example: b=8mm, labeled 08.

### Length of toolholder(mm)

Code	H	K	M	P	Q	R	S	T	U
Length	100	125	150	170	180	200	250	300	350

### Size of insert(mm)

Code	11	16	22	27
Length of triangle	11	16	22	27
Inscribed circle	6.35	9.525	12.70	15.875

A

Common turning Parting and grooving

Thread insert

Thread insert

In order to obtain the best thread processing effect, please follow the steps below:

- 1 Choosing the right thread processing way.
- 2 Choose helix angle, choose shim.
- 3 Choose the appropriate insert and size of toolholder.
- 4 Reference standard thread processing programming parameter table, choose appropriate cutting data.
- 5 Choose feed method.

### Machine type of thread tool

### Choose helix angle and shim

The clearance angle of thread mainly along the edge of tool. This will significantly impact on heat dissipation, tool wear extension, tool life, production safety, the quality of the thread. The clearance angle of thread profile depend on the helix angle, because both are similar. If inclined angle different from helix angle, and the clearance angle is changed.

The inclined angle must be the same as helix angle to avoid excessive wear and lead to shorten the tool life. Helix angle is calculated by the following formula:

$$\rho = \arctan \frac{P}{d_2 \times \pi}$$

P=Pitch  
 $d_2$ =Pitch diameter  
 Common inclined angle is 1°, MT standard shim inclined angle is 1°.  
 Calculation of clearance angle:  
 The clearance angle is calculated by the following formula:

$$\beta = \arcsin(\tan \theta \times \tan \alpha)$$

$2\theta$  = Thread profile angle  
 $\alpha$  = Rake angle, external is 10°, internal is 15° for standard tool

If helix angle  $\leq$  clearance angle, the side insert can produce interference, must be replace the shim. Please adjust the difference between helix angle and inclined angle to 2°-0° through replace the shim.

Ex: if P=1.5,  $d_2=24$ mm  
 Helix angle  $1.14^\circ - (2^\circ - 0^\circ) = \text{Inclined } (-0.86^\circ \sim 1.14^\circ)$   
 Choose standard shim 1° to processe.

Pitch	Size	Inclined angle	Shim
0.5-3.0	16	0	MT16-00M
		1	MT16-01M
		2	MT16-02M
		3	MT16-03M
3.5-6.0	22	0	MT22-00M
		1	MT22-01M
		2	MT22-02M
		3	MT22-03M

(MT16-01M or MT22-01M)

Thread profile	$2\theta$	$\beta$	
		External	Internal
60°		8.5°	6°
55°		7°	7°
30°		4°	2.5°
29°		4°	2.5°

4150	320	10-15	10-15				
H	Harded steel	Harded steel	4500	HRC55	40-50	30-40	

- Note:
- The list shows the range number would choose high number in cutting,when use new cutting speed,should check the edge condition.
  - Would use high cutting speed in stainless thread cutting,avoid built-up.
  - Would reduce cutting parameter in small pitch threading and using small nose radius tool.
  - Would use big nose radius roughing to improve small nose radius tool life in using small nose radius tool threading.

### Thread tools feed method

#### Radial in-feed

- Simple to use,high generality.
- The V type chipping caused by machining steel will produce high bend stress on cutting edge.
- It ask for small cutting depth,sharp edge and good toughness when processing.
- High cutting heat,it's hard to control the V type chipping.
- Due to the left and the right of the chipping contact length is long,easy to produce vibration,and increase the nose load.

#### Flank in-feed

- Small bending stress of cutting edge,stable condition,better shape chipping,large cutting depth.
- There is enough space for chipping discharge when flank in-feed.
- Severe wear on right flank.

#### Modified flank in-feed

- Right cutting edge also engage on cutting depth to a certain extent, it can reduce the abrasion on right size of clearance face.
- Small bending stress of cutting edge,stable condition,better shape chipping,large cutting depth
- Good cutting processing performance.

#### Alternate flank in-feed

- Alternate use cutting edge,even wearing of left and right side back tool face,can lengthen tool life.
- Chipping discharge from left and right direction,good chip flow.
- Suitable for big pitch thread cutting.

**!** Try to use Flank in-feed or Alternate flank in-feed under the condition of machine tools and programming system allows,and can effectively eliminate vibration,enough space for chipping discharge between teeth,small stress of cutting edge,stable condition,chipping controlled when processing thread.

## Thread cutting tool

Thread processing applications data

A

Common turning Parting and grooving

Thread insert

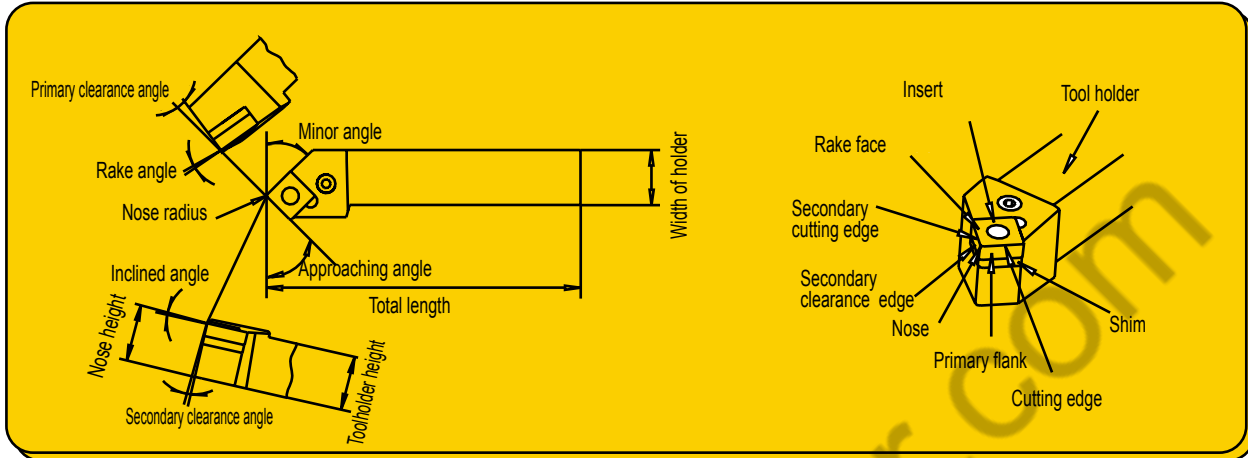

Thread processing applications data

### Thread processing common problems and solutions

Trouble	Reason	Solution
Severe abrasion of clearance face	High cutting speed	Lower cutting speed
	Small feed, cause abrasion	Reduce feed times and edge friction times
	The insert is located in the center line of the above angle of inclination	Choose proper shim to obtain correct angle of inclination
Uneven cutting edge wear	Angle of inclination and helix angle are inconsistent	Change infeed method
	Wrong infeed method	Change infeed method
Breakage	Low cutting speed	Improve the cutting speed
	High cutting force	Increase infeed times, reduce Max. cutting feed
	Turning in the unstable clamping condition	Check stability. Reduce the tool overhanging volume verify clamping of workpiece and tool.
	Chipping are twisting	Increase the cooling fluid pressure, blow chip
Plastic deformation	High cutting speed, high temperature of cutting zone	Reduce cutting speed Increase feed times, reduce max feed depth
	Insufficient cutting fluid	Increase the cooling fluid supply
Poor surface quality	Low cutting speed The insert is located in the center line of the above Chipping uncontrolled.	Increase cutting speed Adjust the center height Change the feed type of tool, proper handle chipping
Incorrect thread profile	Incorrect center height.	Adjust the center height.
	Incorrect pitch.	Check the machine tool
Shallow thread profile	Wrong set of cutting depth	Change cutting depth
Surface damage	Chipping involved or contact.	Use tooth flank cross cutting, control chipping discharge direction.
Built-up edge	Low temperature of cutting edge When machining stainless steel and low carbon steel.	Increase the cutting speed cutting fluid pressure and concentration, choose better toughness tool
Fracture of surface	High cutting force	Reduce cutting depth
Vibration	Incorrect clamping of workpiece or tool	check the clamping condition Min overhang of tool.
	Incorrect of cutting parameter	Increase cutting speed or largely reduce cutting speed
	Incorrect of tool clamping.	Adjust the center height

The functions of each part of turning tools

1. The names of each part of turning tools

2. Effects of rake angle

Large rake angle makes cutting edge sharper, reduces resistant forces of chip flow, diminishes friction and prevent deformation, leading to smaller cutting forces and cutting power, lower cutting temperature, less abrasion and higher surface quality. However, too large rake angle would reduce the rigidity and strength of tool. Heat can't be diffused easily. Serious breakage and abrasion on tool would occur, reducing tool life. Please choose rake angle according to machining conditions.

Value selection	Situations
Small rake angle	<ul style="list-style-type: none"> <li>● When machining brittle and hard materials</li> <li>● When roughing and intermittent cutting</li> </ul>
Big rake angle	<ul style="list-style-type: none"> <li>● When machining plastic or soft materials</li> <li>● When finishing</li> </ul>

3. Effects of clearance angle

The main function of clearance angle is to reduce the friction between the clearance face of tool and surface of workpiece. When the rake angle is fixed, larger clearance angle can increase the sharpness of cutting edge, reduce cutting force and friction, and then achieve higher surface quality. However, if clearance angle is too large, the strength of cutting edge would decrease. Also, heat can't be diffused easily and serious abrasion would occur, reducing tool life.

The principle of choosing clearance angle: Choose small clearance angle if friction is not serious.

Value selection	Situations
Small clearance angle	<ul style="list-style-type: none"> <li>● In order to increase nose strength when roughing</li> <li>● When machining brittle and hard materials</li> </ul>
Big clearance angle	<ul style="list-style-type: none"> <li>● In order to reduce friction when finishing</li> <li>● When machining materials easy to be hardened</li> </ul>

4. Effect of inclined angle

Positive or negative inclined angle determines the direction of chip flow, and also affects the strength and impact resistance of insert nose.

- ◆ As diagram(1) shows, when the inclined angle is negative, namely nose is in the lowest point as apposed to the bottom of tool, chips flow to the machined surface of workpiece.

- ◆ As diagram(2) shows, when inclined angle is positive, namely the nose is in the highest point as apposed to the bottom of the tool, chips flow to the areas of workpiece surface that haven't been machined.
- ◆ The change of inclined angle also affects insert nose strength and impact resistance. When the inclined angle is negative, the nose is in the lowest point of cutting edge. When the cutting edge enters the workpiece, the contacting point is on the cutting edge or rake face, protecting the nose from impact and increase the strength of the nose. Normally, negative inclined angle should be chosen for tools with big rake angle. This can not only increase nose strength, but also prevent the impact of entry.

Value selection	Situaiions
Small approach angle	● For those materials with high intensity,high hardness and hardened layer on the surface
Big approach angle	● When rigidity of the machine is not enough

#### 5、Effect of approach angle

Reduced approaching angle increase the strength of tools and enable heat to diffuse easily, improving surface quality. This is because when the approach angle is small, cutting edge width is large, and then the unit width of cutting edge bears less cutting force. Meanwhile, tool life can be improved.

Normally, select 90 approach angle for turning of slender and step shaft; select 45 approach angle for external turning, end surface machining and chamfering. When approach angle is larger, radia force is reduced, cutting is stable, cutting thickness is increased, and chip breaking is excellent.

#### 6、Effect of minor angle

Minor angle is the main angle that can affect surface quality, and it can also affect tool strength. If the approach angle is too small, the friction between the secondary flank and machined surface of workpiece will increase, causing vibration.

The principle of selecting minor angle: Select small minor angle when roughing or when the friction is unaffected and there is no vibration. Select large minor angle when finishing.

#### 7、Nose radius

Nose radius significantly affects nose strength and surface quality. Large nose radius means higher cutting edge strength, and the abrasion on the rake face and clearance face can be reduced to some extent. However, if the nose radius is too large, radias force will increase, and vibration ia easy to occur, affecting machining precision and surface quality.

Value selection	Situaiions
Small nose radius	<ul style="list-style-type: none"> <li>● Finishing at small cutting depth</li> <li>● Machining parts such as slender shaft</li> <li>● When the rigidity of the machine is not enough</li> </ul>
Large nose radius	<ul style="list-style-type: none"> <li>● When roughing</li> <li>● When machining hard materials,intermittent cutting</li> <li>● When the rigidity of the machine is not enough</li> </ul>

### Calculate method of turning parameter

#### 1、Calculating the cutting speed

$$V_c = \frac{\pi \times D \times n}{1000} \text{ (m/min)}$$

Vc: Cutting speed

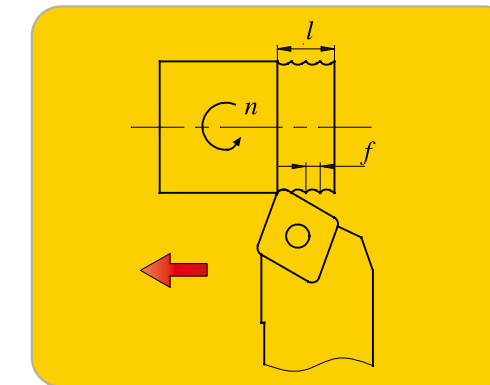

n: Spindle speed

D: Workpiece diameter

Ex: If spindle speed is 280 rev/min,turning the diameter of 150mm,the cutting speed is:

$$V_c = \frac{\pi \times D \times n}{1000} \text{ (m/min)} = 132 \text{ (m/min)}$$

#### 2、Calculating the cutting feed

$$f = \frac{l}{n} \text{ (mm/rev)}$$

f: Feed rate per revolution

l: Cutting length per minute

n: Spindle speed

Ex: If spindle speed is 500rev/min,cutting length per minvte is 100mm/min,the feed rate per revolution is:

$$f = \frac{l}{n} = \frac{100}{500} = 0.2 \text{ (mm/rev)}$$

### 3、Calculating the cutting time of external and internal

$$T = \frac{l}{f \times n} \text{ (min)}$$

T:Cutting time

l:Length of cutting zone

f:Feed rate

n:Spindle speed

Ex:If spindle speed is 250rev/min,feed rate is 0.2mm/rev, the cutting length is 150mm, the time requires:

$$T = \frac{l}{f \times n} = \frac{150}{0.2 \times 250} = 3 \text{ (min)}$$

### 4、Calculating the time of face turning(constant line speed)

$$T = \frac{\pi \times (a^2 - b^2)}{4000 \times V_c \times f} \text{ (min)}$$

T:Cutting time

V<sub>c</sub>:Cutting speed

f:Feed rate

If it's no inner hole of turning face,b=0,the formula is still valid.

### 5、Calculating the theoretical value of surface roughness

$$R = \frac{f^2}{8r_c} \times 1000 \text{ (}\mu\text{m)}$$

R:The theoretical value of surface roughness

f:Feed rate

r<sub>c</sub>:Nose radius

Ex: If feed rate is 0.2mm/rev,nose radius is 0.4mm,the theoretical value of surface roughness is:

$$R = \frac{f^2}{8r_c} \times 1000 = \frac{0.2^2}{8 \times 0.4} \times 1000 = 12.5 \text{ (}\mu\text{m)}$$

### Effect of three main turning parameters on machining

#### ★ Effect of three main parameters

Normally, short machining time, long tool life and high machining precision are expected in machining, so the material quality, hardness, and the shape of the workpiece, and properties of machine should be fully considered, and then we can select suitable tools adopt high-efficiency cutting parameters, namely three parameters.

(1) Normally tool life would be reduced to half when the cutting speed is increased by 20%. Tool life would be 20% of the original life if the cutting speed is raised by 50%.

(2) Low speed (20-40m/min) cutting would easily cause vibration and shorten tool life.

#### ★ Feed rate (fn)

Feed rate is defined as the moving distance of tool after workpiece rotates for one circle, measured by mm/rotation.

#### ★ Effect of feed rate

Feed rate is a key factor that determines surface quality. Meanwhile it also affect the range of chip formig and the thickness of chips during machining.

In terms of the effect on tool life, small feed rate leads to serious abrasion on clearance face, greatly reducing tool life.

#### ★ Cutting depth (ap)

Cutting depth is defined as the difference between machined surface and unmachined surface, measured by mm. It is half the difference value between the original diameter and machined diameter.

#### ★ Effect of cutting depth

Cutting depth should be determined by the machining allowance and shape of workpiece, power and rigidity of machine, and tool rigidity.

The change of cutting depth has little effect on tool life. If the cutting depth is too low, the cutting nose only scrapes the hardened layer on the workpiece surface, reducing tool life. When there is hardened oxide layer on workpiece surface, higher cutting depth should be adopted within the possible range of machine's power to avoid cutting nose just cutting the hardened layer of workpiece.

#### ★ Cutting speed(Vc)

When the workpiece is rotating on the machine, the number of its rotation per minute is defined as Rotating speed of main axle (n). Because of its rotation, the cutting speed measured on the contacting point of diameter is defined as linear speed, m/min. Normally, linear speed is considered to measure the effect of cutting speed on machining.

#### ★ Effect of cutting speed

Cutting speed has significant effect on tool life. When the cutting speed is increased, cutting temperature will increase and tool life will be shortened. Cutting speed varies according to the different types and hardness of workpiece. The below conclusions are reached after many cutting experiments:

### Difference and selection between down milling and up milling

Down milling: the feed direction of workpiece is the same as that of the milling rotation at the connecting position.  
 Up milling: the feed direction of workpiece is opposite to the milling rotation at the connecting position.

In down milling, the major force of cutting edge is compressive stress; in up milling, cutting edge bears the tensile stress. The compressive strength of cemented carbide material is larger than its tensile strength. In down milling, chip becomes thin from thick gradually, cutting edge and workpiece press each other. The friction between edge and workpiece is small, thus can reduce the abrasion of edge, the hardening of workpiece surface and the surface roughness (Ra). In up milling, chip becomes thin gradually. When insert cutting into the workpiece, it generates strong friction and more heat than down milling, and make workpiece surface harden.

In up milling, because horizontal direction of cutting force that milling cutter conduction on workpiece is opposite to the feed direction of workpiece, therefore the lead screw of work table joints closely with one side of screw nut. In down milling, the direction of cutting force is same as the feed direction. When edge's radial force on workpiece is big enough to some extent, the work table will bounce left and right, thus make the gap fall behind. The gap will return to front side along with the continuing rotation of lead screw. At this moment the work table stops motion, however it will bounce left and right again when the radial cutting force is big enough to some extent again. The periodical bounce of work table will cause poor surface quality of workpiece and tool breakage.

When use end mills for down milling, every time the edges begin the cutting at workpiece surface, therefore end mills are not suitable for machining the workpiece with the hardened surface. Up milling is recommended for milling the thin-wall components or square milling with the demand of high precision.

### Pitch selection

Pitch is the distance between one point on one cutting edge and the same point on the next edge. Milling cutters are mainly classified into coarse, close and extra close pitches.

Stability of operation		
L (Low)	M (Medium)	H (High)
<b>Coarse pitch</b> 	<b>Close pitch</b> 	<b>Extra close pitch</b> 
When the milling width is equal to diameter of cutter, the machining system is stable and main power of machine is sufficient, selecting coarse pitch can achieve high productive efficiency.	General milling function and multiple mixed productions	When the milling width is less than diameter of cutter, cutting by maximum edges can achieve high productive efficiency.

### Approach angle selection

The approach angle is composed by insert and tool body, chip thickness, cutting forces and tool-life are affected especially by the approach angle and spreads the cutting area between cutting edge and workpiece for a given feed rate.

A smaller approach angle also guarantee that it is stable entering into or exiting workpiece, to protect the cutting edge and extend tool life. However this will increase higher axial cutting forces on the workpiece, thus is not suitable for machining thin workpiece such as thin plate.

Approach angle	Feed rate per tooth	maximum cutting depth
90°	$f_z$	$h_{ex} = f_z \times \sin \alpha$
75°	$f_z$	$h_{ex} = 0.96 \times f_z$
60°	$f_z$	$h_{ex} = 0.86 \times f_z$
45°	$f_z$	$h_{ex} = 0.707 \times f_z$
Round insert	$f_z$	$h_{ex} = \frac{\sqrt{iC^2 \times (iC - 2a_p)^2}}{iC} \times f_z$

### General formule

$V_c$  : Cutting speed(m/min)     $V_f$  : Feed rate of worktable(feed speed)(mm/min)     $D_c$  : Nominal diameter of milling tool(mm)  
 $f_z$  : Feed rate per tooth(mm/z)     $n$  : Spindle speed(rev/min)  
 $\pi$  : Circumference ratio=3.14  
 $z_n$  : Tooth NO.     $T_c$  : Machining time(min)  
 $Q$  : Metal removal rate(cm<sup>3</sup>/min)  
 $f_r$  : Feed rate per revolution(mm/rev)     $L$  : Real cutting distance(mm)

● Cutting speed

$$V_c = \frac{\pi \times D_c \times n}{1000} \text{ (m/min)}$$

● Spindle speed

$$n = \frac{1000 \times V_c}{\pi \times D_c} \text{ (rev/min)}$$

● Feed rate of worktable(feed speed)

$$V_f = f_z \times n \times z_n \text{ (mm/min)}$$

● Feed rate per tooth

$$f_z = \frac{V_f}{n \times Z_n} \text{ (mm/z)}$$

● Feed rate per revolution

$$f_n = \frac{V_f}{n} \text{ (mm/rev)}$$

● Machining time

$$T_c = \frac{L}{V_f} \text{ (min)}$$

● Metal removal rate

$$Q = \frac{a_p \times a_e \times V_f}{1000} \text{ (cm}^3\text{/min)}$$

### Function of each part in face milling

Main angles of face mills

#### Main angles of face mills

Name	Function	Effect
Axial rake angle $r_f$	Determining the chip direction	Negative angle: good chip removal performance
Radial rake angle $r_p$	Determining whether the cutting is light and fast or not	Positive angle: good chip removal performance
Approach angle $K_r$	Determining the chip direction	$K_r \uparrow$ , chip thickness $\uparrow$ ; $K_r \downarrow$ , chip thickness $\downarrow$ ;
Rake angle $R$	Determining whether the cutting is light and fast or not	Poor cutting performance, high strength of cutting edge (-) $\leftarrow 0 \rightarrow$ (+)    Good cutting performance, low strength of cutting edge
Inclined angle of cutting edge $\lambda_S$	Determining the chip direction	Poor cutting performance, high strength of cutting edge (-) $\leftarrow 0 \rightarrow$ (+)    Good cutting performance, low strength of cutting edge

#### Characteristics of different rake angles combined

		Double positive	Double negative	positive, one negative

### ■ Cutting performances of different approach angles

Approach angle	45°	75°	90°
Schematic diagram			
Instruction	Axial force is the largest. It will bend when machining thin-wall workpiece, and reduces the precision of workpiece. It is benefit to avoid fringe breakage of workpiece when machining cast iron.	The main purpose is to resolve the radial cutting force, it is often used for general face milling.	The axial force is zero in theory, suitable for milling thin plate workpiece.

### Wiper insert

It has axial and radial run out because of tools and inserts exist manufacturing tolerance. The axial runout lead to poor surface roughness.

### Solution

Assembling wiper insert

### Usage

The wiper insert must protrude below the other insert by 0.03-0.05mm at axial direction, only that the wiping function can take into effect. Generally speaking, a cutter can just assemble only one wiper insert. If the diameter of cutter is much bigger or cutter's feed rate per revolution is bigger than the length of wiper edge, 2 to 3 wiper inserts can be assembled.

### ■ Selection of cutting width and tool cutting diameter in face milling

Dc: Tool cutting diameter  
ae: Cutting width

Generally speaking, the relation between cutting width and tool cutting diameter is  $D_c = (1.2 - 1.5) a_e$ . In the machining practice, it need to avoid coincidence of tool center and workpiece center as much as possible.

# General technical information

## Cutting tool used in security matters needing attention

Risk	Measure
Direct contact with sharp cutting edge may cause harm to human body	When you install or remove the cutting tool in the machine tool, please use gloves and other protective labor insurance supplies.
Inappropriate use tool can lead to the breakage, attachment, cause damage	Read the sample and safety standards before use
	Please use the protective glasses and protective clothing
Excessive wear and dramatic impact the cutting resistance, can lead to rupture and the splash, cause harm to the operator	Replace the excessive wear of cutting tool in a timely manner
	Please use the protective glasses and protective clothing.
In the process of cutting chip may cause burns and scratches to the people	Use tools such as forceps to remove scraps in a timely manner
	Please use the protective glasses and protective clothing and protective glove
Sparks in cutting process and high temperature chip is in danger of fire and explosion.	Remove flammable items in the cutting area
	Please get everything ready for fire extinguishing equipment
Speed of machine tools such as fixture balance difference caused by violent vibration, result in tool breakage.	Before cutting, check whether the device is loose or abnormal sound
	Please use the protective glasses and protective clothing
The defects such as burrs on the work piece is very sharp, easy to scratch the body	Please don't touch the burr on the work piece
	Please use the protective gloves and protective clothing
No clamp work piece processed directly causes tool breakage and splash of work piece.	Must be firmly clamp the work piece
	Please use the protective glasses and protective clothing
In the insert or insert attachments were not tightened properly under the situation of cutting, tool shed fly out the risk of damage.	Confirmation before processing blades and other accessories have tighten properly with proper tools
With auxiliary tools such as excessive fastening screw pin or shim, insert or with broken splash of danger.	Please don't use auxiliary tools such as casing too tighten
When high speed cutting insert or attachment, likely due to the inertia fall off under the action of centrifugal force.	Please don't use auxiliary tools such as casing too tighten
	Please use the protective glasses and protective clothing
As a result of the milling cutter winger, directly touch may cause scratches	For your safety, under the condition of the blade must contact your protective gloves
Rotary cutting, clothing, gloves, etc. It is easy to ground to the high speed running equipment, causing casualties	When rotate cutting, please don't wear gloves in processing.
	Attention : don't let the clothes contact with the running machine parts
Eccentric rotating or balance tool in spinning processing will produce bad shake vibration damage caused by flying lead to harm	Please use cutting tools within the scope of permissible speed
	Check the balance of mechanical properties
When high speed cutting, high speed flying out of the chip is likely to cause harm	Use safety cover, protection screen, housing, etc
	Please use the protective glasses and protective clothing and gloves
With minimal cutting tools for drilling, easy to cause break splash and unable to remove the cutting tool	Reduce the vibration of the cutting tool and under appropriate speed processing
	Please use the protective glasses and protective clothing and gloves
The improper use, will cause the acceleration damage of machine tools and cutting tools, and other hazards.	Please use according to instructions and regulations

Remark: if without our permission, without authorization to modify tool caused by the accident, the company is not responsible for

# General technical information

## Surface roughness

Surface roughness is refers to the processed surface of small spacing and small peak valley roughness. Surface roughness has close relation with the properties of mechanical parts, abrasion resistance, working accuracy and corrosion resistance, impact to the machine or equipment reliability and life expectancy.

variety	Code	computing method	Calculation method (figure)
Profile arithmetic average error	Ra	<p>Within the sampling length <math>l</math> contour offset distance absolute value of the arithmetic average</p> $R_a = \frac{1}{l} \int_0^l  y(x)  dx$ <p>Type in the contour offset <math>y</math> refers to the distance between the ontour points and the the reference line. Reference line for least squares line <math>O</math> outline. The line dividing profile and make it within the sampling length profile deviation from the line of sum of squares to a minimum.</p>	
Ten point height of irregularities	Rz	<p>Within the sampling length <math>l</math> of the outline of the five biggest peak height and the outline of the five biggest deep valley of the average the sum of the average</p> $R_z = \frac{\sum_{i=1}^5 y_{pi} + \sum_{i=1}^5 y_{vi}}{5}$ <p>Type: <math>y_{pi}</math> is the outline of the <math>i</math>th a maximum peak height, <math>y_{vi}</math> is one of the largest outline the <math>i</math>th a deep valley. Outline of the maximum height <math>R_y</math>: peak within the sampling length <math>l</math> contour line and contour of the distance between the bottom line.</p>	
Maximum height of the profile	Ry	<p>Peak within the sampling length <math>l</math> contour line and the contour of the distance between the bottom line. Outline the summit line is parallel to the baseline and peak by contour line; Outline the bottom line is parallel to the baseline and low by contour lines.</p>	

Sampling length  $l$  and assess value of length  $l_n$

$R_a / \mu m$	$R_z / \mu m$	$l/mm$	$l_n=5l /mm$

Note

- The basic size greater than 500 mm, IT1 to IT5 standard tolerance value for trial.
- The basic size less than or equal to 1 mm, no IT4 to IT18.

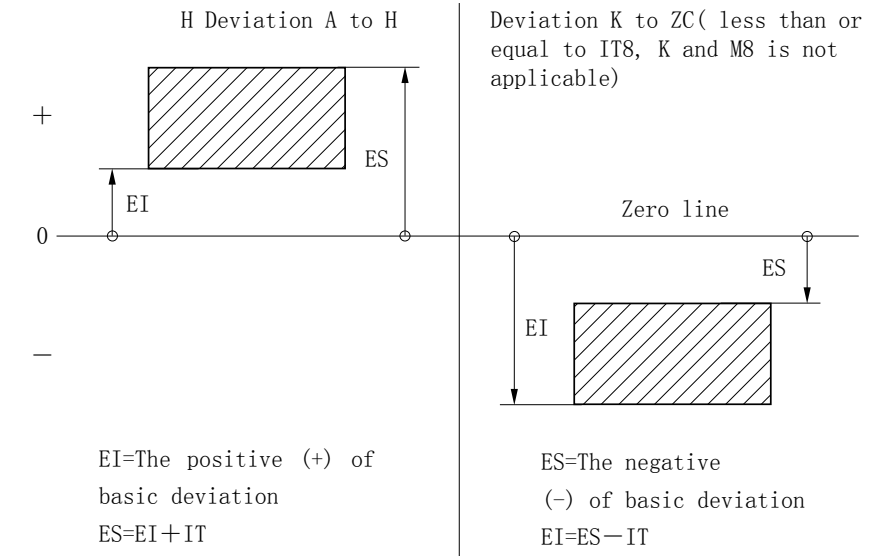

# General technical information

## Fit dimension tolerance

Lower deviation (ei) and upper deviation (es) of axis can be made of axis basic deviation and the standard of tolerance(IT)

Lower deviation (ei) and upper deviation (es) of hole can be made of hole basic deviation and the standard of tolerance(IT)

For example: for a  $\emptyset 3$ , tolerance grade for the H7 hole, from the basic principle of hole deviation value in the table to check the size range of tolerance grade class H Lower deviation EI = 0, and tolerance to 7 class corresponding to the standard tolerance of IT =  $10 \mu\text{m}$ , the upper deviation ES = EI + IT =  $10 \mu\text{m}$ .  
hole fit dimension is  $\emptyset 3 \begin{matrix} +0.01 \\ 0 \end{matrix} \text{mm}$ .

Deviation =  $\pm \frac{IT_n}{2}$ , and IT<sub>n</sub> is the number of IT

Note: 1. The basic size less than or equal to 1 mm, basic deviation of a and b are not used.  
2. If tolerance zone js7 to js11, IT<sub>n</sub> number values is odd, the deviation =  $\pm \frac{IT_n-1}{2}$

Deviation = ± ITn/2, and ITn is the number of IT

More than IT7 corresponding numerical increase a Δ value

- Note: 1. The basic size less than or equal to 1 mm, basic deviation of A and B and is greater than IT8, N are not used  
 2. If tolerance zone js7 to js11, ITn number values is odd, the deviation = ±(ITn-1)/2  
 3. For less than or equal to IT8 K, M, N and less than or equal to IT7 P to ZC, required Δ values from a table in the right selection  
 For example: 18<sup>h</sup>30mm, K7: Δ=8 μm, so ES=-2+8=+6 μm  
 18<sup>h</sup>30mm, S6: Δ=4 μm, so ES=-35+4=-31 μm  
 4. Special cases: 250 ~ 315 mm segment of the M5, ES= -9 μm (instead of -11 μm).

25.0	—	255	251	835	17.0	—	211	211	710
24.5	—	252	248	830					

Note: this table listed all the equivalent value of steel tie, applicable to steel from low to high carbon content  
 Tensile strength values listed in this table, suitable for general steel grade of conversion accuracy is not high, 1N/mm<sup>2</sup>=1Mpa.  
 This table from GB1172-74.

## 材质项目名词解释

### Definition of Physical Property

#### ◎硬度

Hardness

金属材料抵抗其它更硬物体压入表面的能力称为硬度，主要采用洛氏或维氏硬度测量法，两种硬度值转换时需要注意换算。

The hardness of material is defined as the ability to fight against the hard pressed into surface of the object, mainly using measurements of Rockwell and Vickers. As the principles of the Vickers and Rockwell tests are different, care must be taken when converting from one system to the other.

#### ◎矫顽磁力

Coercive force

矫顽磁力测量的是合金试样完全去磁化所需的反向磁场大小，它可用来评定合金的组织状况，矫顽磁力随钴含量降低而增大，当钴含量一定时，碳化钨晶粒越细，钴相分散程度越高，矫顽磁力也越大。

Coercive Force is a measure of the residual magnetism in the hysteresis loop when the Cobalt (Co) binder in grade of cemented carbide is magnetized and then demagnetized. It can be used to assess the status of alloy organization. The finer the grain size of the carbide phase the higher will be the coercive force value.

#### ◎磁饱和

Magnetic saturation

磁饱和是最大磁化强度与质量的比值，通过测定硬质合金中具有磁性的钴（Co）粘结相的磁饱和，可以评定合金成份。低磁饱和值表示合金含碳量低，或者含有η相碳化物，高磁饱和值表示存在“游离磷或石墨”。

Magnetic saturation is the ratio of magnetic intensity to quality. Magnetic Saturation measurements on the Cobalt (Co) binder phase in cemented carbide are used by the industry to evaluate its composition. Low Magnetic Saturation values indicate a low carbon level and/or the presence of EtaPhase Carbides. High Magnetic Saturation values indicate the presence of 'free carbon' or Graphite.

#### ◎密度

Density

材料的密度（比重）是材料质量与其体积的比率，使用液体置换法进行测定，硬质合金密度随WC-Co相中钴含量增加而增加。

The density (specific gravity) of a material is the ratio of its mass to its volume. It is measured using a water displacement technique. Cemented carbide density decreases linearly with increasing Cobalt content for the We-Co Grade.

## 材质项目名词解释

### Definition of Physical Property

#### ◎抗弯强度

Transverse rupture stress

抗弯强度是表征材料抵抗弯曲不断裂的能力，即试样跨距中点加载负荷至断裂时，单位面积上所受的力大小。

The Transverse Rupture Stress (TRS) is the ability of material to resist bending, measured at the breaking point of a material in a standard three point bend test.

#### ◎金相

Metallographic

硬质合金烧结钴相粘结后，过量钴可能在某些结构区域中存在，形成“钴池”；而当粘结相不完全粘结，则将形成一些少量残余孔隙，合金中钴池及孔隙率使用金相显微镜检验得到。

Cobalt phase will bond after sintering, excess cobalt may exist in certain area of the structure, forming the cobalt pool; If bonding phase is incompletely adhesive, there will form some residual pores. Cobalt pools and porosity can be detected by using metallographic microscope.

#### ◎孔隙度

Porosity

ISO 4505

硬质合金是使用粉末冶金方法制造的，其中金属粘结相用于将碳化相烧结在一起。因此存在这样的可能：由于不完全的烧结，少量的残余孔隙会存在于产品的金相结构中。材料中存在的孔隙的体积是使用一种标准的比较程序来评价的。后者根据一系列的标准图谱将孔隙尺寸范围和分布分成不同类别。尺寸10微米以下的孔隙称为“A”型孔隙。尺寸10-25微米的孔隙称为“B”型孔隙。更大尺寸的孔隙单独测量和分类。硬质合金中孔隙的存在对机械性能有负面的影响。

ISO 4505

Cemented carbide is manufactured by powder metallurgy and the metal binder phase is used to sinter together the carbide phase. So there exists such a possibility: A small amount of residual pores are present in the microstructure of cemented carbide due to the incomplete sintering. The volume of the pores present in the material is to be evaluated by a standard comparison procedure. The latter divides the scope of dimensions and the distribution of pores into several categories: A pore under 10 microns is called porosity "A" A pore of 10-25 microns is called porosity "B" Pores of bigger dimensions are to be measured and classified separately. The existence of pores in cemented carbide will have adverse effects on its mechanical properties.

## 材质项目名词解释

### Definition of Physical Property

#### 钴池

Cobalt lake

硬质合金是采用金属粉末冶金方法制造的。其中金属粘结相用于将碳化物相烧结在一起。因此存在这样的机会：烧结后结构中某些地方存在过多的钴。这种情况被称为“钴池”。钴池是烧结时钴的不完全分布的结果。这可能是由于烧结温度过低，钴不能充分流动。原始粉末材料成形密度不够，或是在热等静压处理时孔隙被钴填充结果。材料中钴池体积的评价是根据其尺寸和分布采用显微照片比较和/或单个测量。硬质合金中钴池的存在会影响耐磨性和强度。

Cemented carbide is manufactured by powder metallurgy and the metal the binder phase is to sinter together the carbide phase. So there exists such an opportunity: Too much cobalt is present in some places of structure after the sintering process and it is called "cobalt lake". Cobalt lake is caused by the incomplete distribution of cobalt in the sintering process. The reason may be the too low sintering temperature to hinder the sufficient flow of cobalt, the insufficiency of density of the virgin compacted material or the filling of cobalt into the pores in the HIP process. The evaluation of the volume of cobalt lake in the material is made by the comparison of micrographs and/or measurement of one by one based on the sizes and distribution. The presence of cobalt lake in cemented carbide will affect its wear resistance and strength.

#### 自断裂韧性

Fracture toughness KIC

断裂韧性KIC是含有临界尺寸缺陷的试样的强度测量尺度，它反映材料塑性变形和断裂全过程中吸收能量的能力，是强度和塑性的综合表现，使用维氏压痕法测定。

Fracture toughness KIC is the measurement strength of samples containing critical defect. Fracture toughness reflects the ability of material to absorb energy in the process of plastic deformation and fracture. Fracture toughness is the performance of strength and the plasticity, which is measured by Vickers.

#### 总碳含量

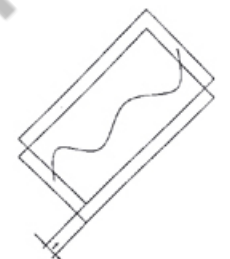

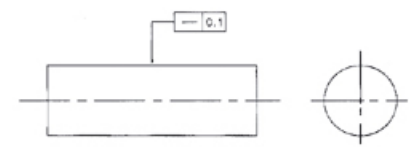

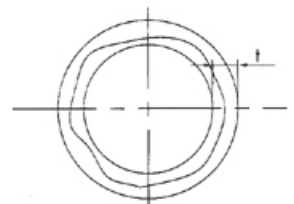

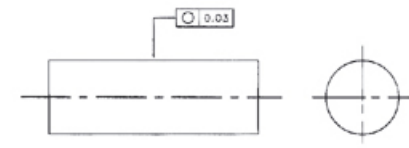

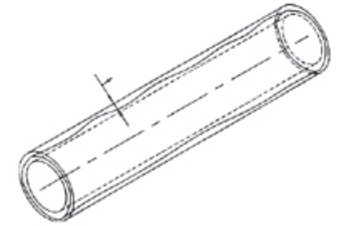

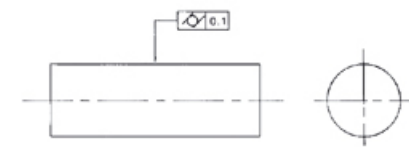

The total carbon

碳化钨(WC)中理想碳含量范围是6.05-6.14%，高于6.14%，将导致组分中明显的碳过量，超过化学计量值，形成“游离碳”，少于6.02%，将形成 $\eta$ 相碳化物。

The Ideal amount of Carbon In Tungsten Carbide (WC) is 6.13% by weight. An acceptable range of Carbon is 6.05-6.14%, any amount less than 6.02% will result in visible Carbon deficiency by the formation of the Eta-Phase carbides, any amount greater than 6.14% will result in a visible Carbon excess by the formation of 'free-carbon, graphite in the microstructure.

## 尺寸项目名词

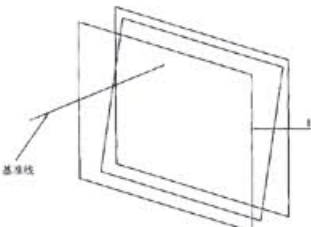

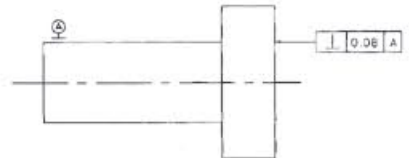

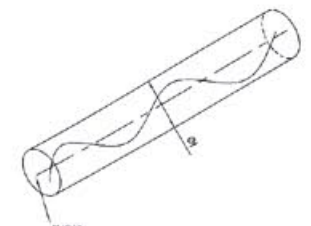

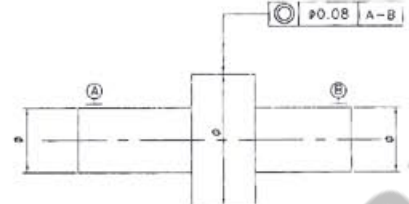

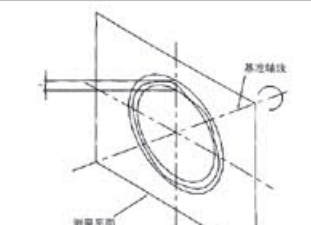

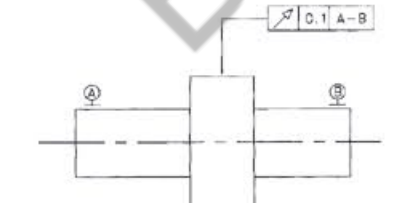

### Definition of Geometrical Tolerances

	公差带定义 Definition of Tolerance Zone	标注和解释 Indication and Explanation
直线度 Straightness Tolerance	 <p>在给定方向上公差带是距离公差值t的两平行平面之间的区域。 The tolerance zone, in the considered plane, is limited by two parallel straight lines a distance t apart and in the specified direction only.</p>	 <p>被测圆柱面的任一素线必须位于距离为公差值0.1的两平行平面之内。 Any extracted (actual) line on the upper surface, parallel to the plane of projection in which the indication is shown, shall be contained between two parallel straight lines 0.1 apart.</p>
圆度 Roundness Tolerance	 <p>公差带是在同一正截面上，半径值为公差值t的两同心圆之间的区域。 The tolerance zone, in the considered cross-section, is limited by two concentric circles with a difference in radii of t.</p>	 <p>被测圆柱面任一正截面的圆周必须位于半径差为公差值0.03的两同心圆之间。 The extracted (actual) circumferential line, in any cross-section of the cylindrical and conical surfaces, shall be contained between two co-planar concentric circles, with a difference in radii of 0.03.</p>
圆柱度 Cylindricity	 <p>公差带是半径差为公差值t的两同轴圆柱面之间的区域。 The tolerance zone is limited by two coaxial cylinders with a difference in radii of t.</p>	 <p>公差带是在同一正截面上，半径差为公差值t的两同心圆之间的区域。 The tolerance zone, in the considered cross-section, is limited by two concentric circles with a difference in radii of t.</p>

### 尺寸项目名词

Definition of Geometrical Tolerances

公差带定义 Definition of Tolerance Zone	标注和解释 Indication and Explanation
<p><b>垂直度</b> Perpendicularity Tolerance of a Surface</p>  <p>公差带是距离为公差值t且垂直于基准线的两平行平面之间的区域。 The tolerance zone is limited by two parallel planes a distance apart and perpendicular to the datum.</p>	 <p>被测面必须位于距离为公差值0.08且垂直于基准线A(基准轴线)的两平行平面之间。 The extracted (actual) surface shall be contained between two parallel planes 0.08 apart that are perpendicular to datum axis A.</p>
<p><b>同轴度</b> concentricity Tolerance of a point</p>  <p>公差带是直径为公差值t的圆柱面内区域,该圆柱面的轴线与基准轴线同轴。 The tolerance zone is limited by a circle of diameter t, the tolerance value shall be preceded by the symbol F, the centre of the circular tolerance zone coincides with the datum point.</p>	 <p>大圆柱面的轴线必须位于直径为公差值t且与公共基准线A-B(公共基准轴线)同轴的圆柱面内。 The extracted (actual) median line of the tolerance cylinder shall be within a cylindrical zone of diameter t, the axis of which is the common datum straight line A-B.</p>
<p><b>圆跳动</b> Circular run-out Tolerance</p>  <p>公差带是在垂直于基准轴线的任一半径位置的测量平面内,半径差为公差值t且圆心在基准轴线上的两同心圆之间的区域。 The tolerance zone is limited within any cross-section perpendicular to the datum axis by two concentric circles with a difference in radii of t, the centers of which coincide with the datum.</p>	 <p>当被测要素围绕公共基准线A-B(公共基准线)旋转一周时,任一测量平面内的径向圆跳动均不得大于0.1。 The extracted (actual) line in any cross-section plane perpendicular to common datum straight line A-B shall be contained between two coplanar concentric circles with a difference in radii of 0.1.</p>

# ❖ COMPANY PROFILE ❖

Jiangxi Jiangwu Cemented Carbide Co., (JTCC for short) is a wholly-owned by Jiangxi Rare Earth and Rare Metals Tungsten Group Corporation LTD.(JXTC for short).

The JTCC is an important enterprise of JXTC for "let the tungsten form source to deeper machining products" development strategy, producing and sale cemented carbide ready to press powder and many kinds products. In 2011,the company import most advanced equipments and process in the world to building a new production line for indexable inserts and could provide many kinds indexable inserts made of the brands including physical, chemical coating and metal ceramic, to use for high-precision turning, milling, drilling, cutting off, grooving and threading machining etc. also provide all kinds support and technical advisory services for metal cutting tools needed by car ,aviation, spaceflight and mould manufacturing industries.

The company has been qualified ISO9001-2008 certificate and ISO14001-2004 environment management certificate Company adheres to the philosophy of "Refining Quality, Optimizing management" which ensures to provide high quality products and excellent service.

Company located in the northwest of Jiangxi, distance 37Km form provincial capital Nanchang, and has entered one-hour economic circle of Nanchang.

## Quality guaranteed

We have been awarded GB/T19001-ISO9001 Quality System Certificate.

All our products are inspected strictly.
